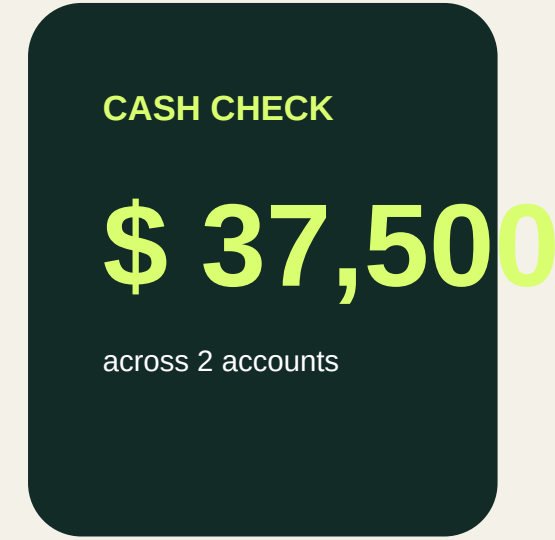
CASH CHECK

Where is all your cash?

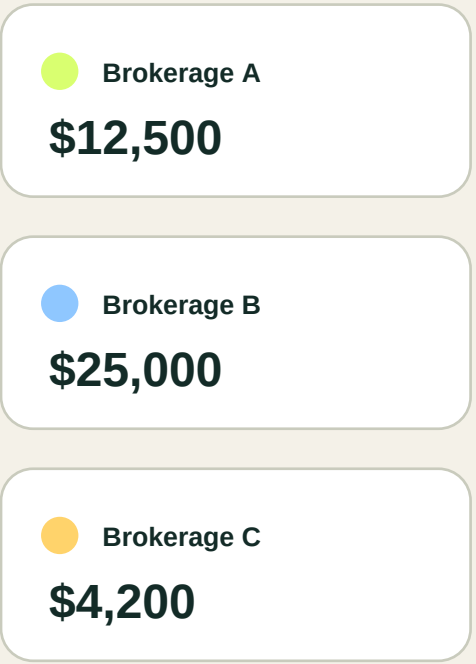
A small, read-only app that brings cash across your brokerage accounts into one clear view. Built by Om Thakur for SnapTrade's Product Engineer exercise.



THE PROBLEM

Your cash can be easy to overlook.

A dividend can land in one account while a deposit sits in another. Seeing the full picture means opening each brokerage and adding it up yourself.



SnapTrade makes the connection practical.

Every brokerage has its own login and data format. SnapTrade handles those connections, so Cash Check can use read-only data in a consistent format and focus on a useful product experience.

It reads. It never trades.

Cash Check shows cash by account and currency, recent money in and out, and a buy-only what-if. It can help a person explore a target mix without turning that exploration into an order.

Cash today

What is available, grouped by currency.

What changed

Money in, money out, and the change over 30 days.

What-if

A target mix you can explore without placing a trade.

A small product with clear boundaries.

The app requests only openid and read permissions. It never sees a brokerage password and never stores balances, holdings, activity, targets, or PDF summaries. Tokens are encrypted on the server so the app can reconnect safely.

WHAT IS SAVED

- Encrypted connection token
- SnapTrade user ID
- Anonymous feedback

What I checked, and what I would learn next.

40 automated tests pass. The production build, type check, lint, and dependency audit pass. The deployed app was checked with SnapTrade sandbox data. Next, I would test a real account, watch the feedback and usage data, and interview people who manage more than one brokerage.

TRY IT
