CASH CHECK

READ-ONLY

BUILT WITH SNAPTRADE

A clearer view of the cash across your brokerage accounts.

Cash Check is a small, deployed product that brings brokerage cash into one place, explains what changed recently, and lets a person explore a buy-only what-if. It never places trades.

TRY IT

Live app: cash-check-nine.vercel.app

Code and implementation notes: github.com/theomthakur/cash-check

Built by Om Thakur. The demo uses sample data.

Cash Check is independent and is not an official SnapTrade product. Not investment advice.

What it helps with

People often use more than one brokerage. A dividend, deposit, or sale can leave cash in separate places, and it is easy to lose track of the total.

See it together

Cash is shown by account and by currency, without adding US and Canadian dollars together.

Understand change

The last 30 days show money in, money out, and the resulting cash change. It does not guess which deposit is still in cash.

Explore a what-if

A person can set a target mix and see how using available cash could change it. The app never sells or places an order.

Why SnapTrade

Every brokerage has its own sign-in and data format. SnapTrade handles the brokerage connections and gives Cash Check read-only data in one consistent format. That means Cash Check can focus on a useful experience instead of rebuilding brokerage integrations.

A simple boundary

Cash Check asks for openid and read permissions only. It never sees a brokerage password, and it never stores balances, holdings, or activity.

How it works, and what was checked

Connection flow

1

You choose Connect

Cash Check sends you to SnapTrade.

2

You sign in with SnapTrade

Cash Check never sees your brokerage password.

3

Read-only access

The connection token is encrypted in Neon.

4

Open your dashboard

Cash Check reads current data, shows it, and does not save it.

Choices made on purpose

Read-only	No trading permissions, no orders, no movement of money.
Separate currencies	No hidden conversion rate changes the total.
Honest history	The 30-day cash estimate names activity types that were skipped.
Small scope	No AI recommendations, fund look-through, or currency conversion.

Verification and honest limits

40 automated tests cover calculations, the PDF summary, encryption, sign-in, token refresh, and feedback. Lint, TypeScript, production build, and dependency audit pass. The deployed app was checked with SnapTrade's Self-directed sandbox scenario on 23 Oct 2026. It has not yet been checked with a real brokerage account.
